## **DETAILED ACTION**

## Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 1/24/06 has been entered.

## Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 3. Claims 1-12 and 15 are rejected under 35 U.S.C. 102(e) as being anticipated by Morikawa. The reference discloses a method for sorting a plurality of items, to each of which a sequence number is assigned (col. 6, lines 7+), into a predetermined sorted sequence using a plurality of sorting regions (210, 230, 302, 303, 300), including for each sort, at least two initial sorting regions(210, 230), and at least two additional sorting regions (302, 303, 300), at least one of the additional sorting regions functioning as a return region, the items being initially located, in an unsorted order, in the at least one initial sorting region, the method comprising the acts of: sorting the items in each of the at least two initial sorting regions into an intermediary sorted set by moving at least some of the items at least one of the initial sorting regions between the at least

one initial sorting region and at least two of the additional sorting regions; and sorting the items within each intermediary sorted set by moving at least some of the items to the return region in substantially the predetermined sorted sequence (col. 5, lines 25+).

- 4. With regards to claim 2, the reference further discloses using a computer to track the location of each of the plurality of items (col. 5, lines 25+).
- 5. With regards to claim 3, the reference further discloses the items are sorted in a single pass (col. 5, lines 25+). Examiner contends that items are sorted to some extent in a single pass, even though the sort is not complete. The claim does not require, for example, a sort to a CWS in a single pass.
- 6. With regards to claim 4, the reference further discloses conveying items from at least one of the return regions serially and in the predetermined sorted sequence (col. 5, lines 10+).
- 7. With regards to claim 5, the reference further discloses placing an identifier with each of the plurality of items (col. 6, lines 6+).
- 8. With regards to claim 6, the reference further discloses checking the identifier to ensure that the order of the items substantially matches the predetermined sorted sequence (col. 6, lines 6+).
- 9. With regards to claim 7, the reference further discloses the items are positioned linearly in the sorting regions (col. 5, lines 25+).
- 10. With regards to claim 8, the reference inherently discloses a computer is used to control the movement and positioning of the items according to a predetermined algorithm.
- 11. With regards to claim 9, the reference further discloses an apparatus for sorting a plurality of postal bins comprising: a plurality of sorting regions, wherein the plurality of sorting

regions comprise for each sorting at least one initial region in which the postal bins are initially located in an unsorted order, at least one return region in which postal bins are located after completion of sorting and at least one additional region used in the sorting; a first mechanism for physically moving at least one postal bin between at least two selected sorting regions; a second mechanism for physically moving at least one item between positions within each sorting region; an postal bin location tracking mechanism; and a controls operative for controlling the first and second mechanisms to move the postal bins into a predetermined sorted sequence at least partly in response to the tracking mechanism (col. 5, lines 25+).

- 12. With regards to claim 10, the reference further discloses at least some of the sorting regions are located one under another and wherein the first mechanism includes an elevator (510, 520)
- 13. With regards to claim 11, the reference further discloses the second mechanism is a conveyor (410, 490).
- 14. With regards to claim 12, the reference further inherently discloses the controls include a processor running a subroutine for issuing instructions according to a selected item sorting algorithm.
- 15. With regards to claim 15, the reference further discloses a plurality of sorting regions, wherein the plurality of sorting regions comprise for each sorting at least one initial region in which the postal bins are initially located in an unsorted order, at least one return region in which postal bins are located after completion of sorting and at least one additional region used in the sorting, means for physically moving at least one postal bin between at least two selected sorting regions of the plurality of sorting regions; means for physically moving at least one postal bin

Art Unit: 3653

between positions within each of the plurality of sorting regions; means for tracking the location of postal bins (col. 6, lines 6+); and means operative at least partly in response the tracking mechanism for controlling the first and second mechanisms to reposition postal bins into a predetermined sorted sequence (col. 5, lines 25+).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jonathan R. Miller whose telephone number is (571) 272-6940. The examiner can normally be reached on M-F: 8:30AM-5:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kathy A. Matecki can be reached on (571) 272-6951. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
